Water Depth Transducer

Can offer a wide range of pressure transducers to suit a wide range of applications that are found in General Industry, Medical and Military arenas.

We have over 40 years experience in making transducers.

Employing foil, ceramic or semiconductor technology this transducer can measure water depths from 0.5 to 500 MWG for full range output.

Typical Pressure Transducer

Lightning suppression is standard on all ranges and advanced electronics allows customer rangeable adjustments to be achieved.

Output is two wire 4-20 mA though a special ruggedised cable.

The unit is available in two different sizes being 50mm and 30mm diameters. The 50mm unit is the standard available in depth range from 0.5 to 500 metres.

A higher cost small bore unit of 30mm diameter allows 10 to 500 metres.

We can usually meet customers specific requirements.

Acam have had a commitment to quality, customer service and technological advancement for over 40 years!
